

Swing Carriage

Swing Carriages - The load capacity of a lift truck jib has a maximum of approximately 1935 lbs to as much as 6000 pounds on either the extended or retracted positions range. You may need to discuss with a material handling specialist concerning the particular restrictions of your forklift use. The load capacity ratings are for the jib itself and not the lift truck or even the maximum load that can be carried securely using a certain lift truck. It is essential to keep in mind that each time any accessories like for instance a lift truck jib are connected to the forklift, the new center of gravity created by the attachment will decrease the general lift capacity of the forklift. There are instructions accessible that offer information on the way to properly gauge these load limits.

Prior to the use of whichever forklift jib, be sure that the shackles and hooks are properly secured to the lift truck. Be sure and even double check that the pins are tight. It is necessary that the weight calculations are correctly done and double checked. Keep in mind to consider the truth that rated capacities sometimes lessen every time the boom is in an elevated position, each time the boom is extended with telehandlers or even each time the mast is slanted frontward.

Several vital tips regarding the modifiable jib are: never pull a load using a forklift jib accessory, because these attachments are actually used for vertical lift only. Always carry the load without letting it move backward and forward. Use extreme caution any time a load is lifted to be able to prevent tipping over the truck.
